GLOBAL ID

MAXIMUM SECURITY. MINIMAL EFFORT.

REINVENTING THE IDENTITY LIFECYCLE

Liga GlobalID is built to handle the entire identity lifecycle from the initial onboarding and validation of the user, the enrollment of multifactor authentication tokens, the everyday use, and the revocation process and reporting for compliance purposes.
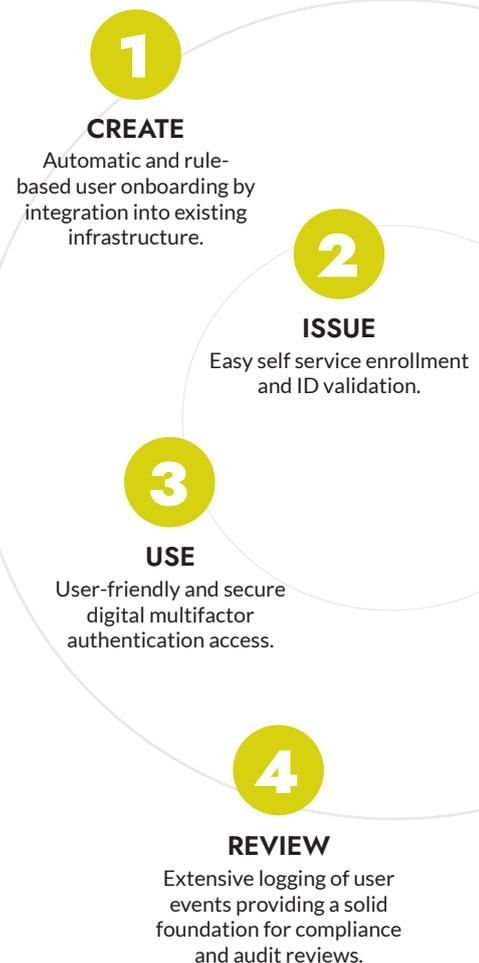

The entire lifecycle handling is built into our Liga GlobalID virtual appliance replacing complex processes and the need for expert knowledge within IT, with automation and self-service.

RELEASE POTENTIAL

Liga GlobalID offers a unique use of authentication and automation to release the full potential of your organization while increasing security.

- Easy introduction of multi-factor authentication
- Convenient self-service onboarding for the users
- Freeing up valuable internal HR and IT resources
- Fulfilment of strict IT compliance requirements
- Easy access to extensive reporting and audit trails

Should your internal HR and IT resources be used for value-creating initiatives instead of administration and manual processes? Then Liga GlobalID is an obvious choice to consider.

1

CREATE
Automatic and rule-based user onboarding by integration into existing infrastructure.

2

ISSUE
Easy self service enrollment and ID validation.

3

USE
User-friendly and secure digital multifactor authentication access.

4

REVIEW
Extensive logging of user events providing a solid foundation for compliance and audit reviews.

FEATURES

BROKERING AUTHENTICATION TECHNOLOGIES

MULTIPLE USER DIRECTORIES

AUTOMATING THE AUTHENTICATION LIFECYCLE

USER SELF SERVICE

ENABLING THE USE OF CERTIFICATES, EVERYWHERE

REAL-TIME SYNCHRONIZATION

STRONGEST AUTHENTICATION SECURITY

ENABLES TRUE SINGLE SIGN-ON

IN DEPTH REPORTING

SUPPORTS MULTIPLE DEVICES

LIGA

BROKERING AUTHENTICATION TECHNOLOGIES

Liga GlobalID is the hub that connects all the components in a certificate-based security infrastructure. The integration with existing user directories, internal or external CAs and the support for multiple authentication devices is all handled in one solution.

The automation of the user lifecycle reduces IT cost by using a well-documented and uniform process for issuing the user identification tokens. In addition, this allows for achieving and documenting compliance towards local, national or international regulations.

The embedded IDM engine allows GlobalID to be integrated into any environment. GlobalID is the hub that makes all the components work seamlessly together.

CERTIFICATE AUTHORITIES (CA)

IDENTITY PROVIDERS (IdP)

MULTIPLE USER DIRECTORIES

Organizations that have been re-organized and merged may be struggling with multiple user directories that are not interconnected. Liga GlobalID brings all the pieces together.

Multiple user directories are supported simultaneously in Liga GlobalID. This allows integration into even the most complex environments. Any combination of on-prem, cloud-based and hybrid user directories are supported.

As soon as a change occurs on a user, eg. a new certificate has been issued, Liga GlobalID's rule-based engine immediately updates the user object in the original directory, while simultaneously logging and time-stamping the operation for compliance.

The real-time synchronization makes a new certificate instantly valid. Correspondingly, a certificate revocation is instantly enforced.

**MAXIMUM SECURITY.
MINIMAL EFFORT.**

AUTOMATING
THE IDENTITY LIFECYCLE

Onboarding of new users has never been so easy. The real-time synchronization allows for newly added users to automatically have a certificate requested, which they can pick up from the GlobalID client application. The certificate is automatically added to the user object in the original user directory, and thus instantly valid for authentication.

Combining GlobalID with a local Identity Provider supporting certificates allows for a passwordless, single-sign-on experience for users. Revocation of certificates can be automated, so that users that are no longer with the company have their certificates revoked and no longer have access to IT systems.

Extensive logging of user events providing a solid foundation for compliance and audit reviews.

USER SELF SERVICE

The Liga GlobaID client application provides 24/7 availability. The client is always ready to issue, renew and even revoke user's certificates and authentication devices.

The client solves the issues of any ad hoc enrollment of employees which means less work for IT administrators. The issuing process includes user identity validation. This can be achieved from either an external eID service or tailored processes like mobile confirmation or manual approval. Sworn statement from the user can be included in the process as well. The Liga GlobalID client works as a stand-alone application or in kiosk mode.

ENABLES MULTIPLE DEVICES

Users come with different requirements and different use cases. Different devices may be convenient in different situations. Liga GlobalID supports multiple devices for a single user. These may be used interchangeable or for different purposes as defined outside the Liga GlobalID system.

REINVENTING THE IDENTITY LIFECYCLE

Liga GlobalID is built to handle the entire identity lifecycle from the initial onboarding and validation of the user, to the enrollment of multifactor authentication tokens, the everyday use, and the revocation process and reporting for compliance purposes.

STRONGEST AUTHENTICATION SECURITY

The digital identity is the single most important factor in securing the IT infrastructure. Liga GlobalID strengthens the resilience against phishing, ransomware and targeted attacks.

The most secure user authentication is based on certificates, a well-established standard. GlobalID simplifies the operation by bringing all the components together. Desktop computers, mobile devices, remote desktops, and web applications are examples that support certificates for strong user authentication out-of-the-box.

IAM AND IDM INTEGRATION

Liga GlobalID allows seamless synchronization with a customer's existing IAM and IDM systems as well as other applications, regardless of existing technologies. This flexible architecture allows deployment in almost any environment and lets an existing IDM system expand it's value to the organization.

True single sign-on can (SSO) be achieved by integrating Liga GlobalD with a local Identity Provider (IdP). This allows the use of a highly secure, certificate-based authentication for almost any kind of IT service. Step-up authentication is another example of overall strengthening of security. Liga GlobalID will integrate with IAM and IDM solutions in both on-prem, cloud-based and hybrid environments.
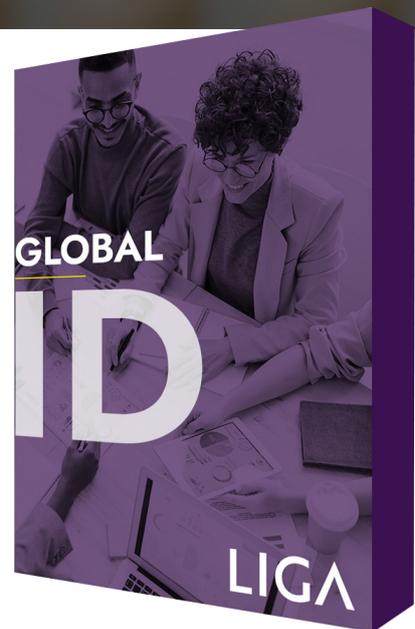

ENABLING THE USE OF CERTIFICATES, EVERYWHERE

Using certificates with a local Identity Provider allows for easy and secure access to IT systems. The use of GlobalID sets the organization on track towards a true password-less infrastructure.

IN DEPTH REPORTING

Auditing data need to be easily accessible for compliance and forensic purposes. This is obtained with Liga GlobalID, which acts as the hub that interconnects the user identity and transaction data.

All transactions are logged and provides a complete audit trail in order to comply with regulations. Detailed reporting is accessible from the user-friendly reporting UI which allows for easy access to details for every user. The transaction log can be integrated with existing SIEM solutions in order to leverage the existing IT environment.
